

Cityzen Application Maintenance

Because this application interfaces so well with Cityzen's existing backend, this application requires little to no maintenance!

Generating Local Notifications:

Once you have created a new poll via Wordpress' backend, you need to manually push the notifications to all mobile users. This can be done by opening Cityzen's phpAdmin center and visiting the schema title *notification* in the citizena_style21 database. Simply create a new entry in this table with the poll's title, description, and traceback address. The traceback address is the URL address of the poll in the cityzen web application. Ex.

<http://cityzenapp.us/core/poll/study2.php> This is the address which the notification will open to when selected.

Changing the Mobile Application's "About" Page:

The HTML code for the application's about page is hosted by Cityzen's backend and is injected into an iframe. It can be found at under /core/mobile/about.html from Cityzen's www home directory. Changes pushed to this page will be directly reflected in the users' applications.
